**THERE ARE TWO GENERAL METHODS USED IN SIZING A POOL HEATER:**

- I. Surface Area and Air Temperature
- II. Water Capacity and Time-Rise

**TO SIZE HEATER - BASED ON SURFACE AREA:**

1. Determine the mean average air temperature for the coldest month in which the pool is to be used. (Available from the local weather bureau.)
2. Determine the desired pool water temperature.
3. Subtract the above two temperatures to determine the temperature difference.
4. Determine the pool surface area.
5. Under the computed temperature difference and horizontally across from the pool surface area, the correct Bryan heater model will be obtained.
6. This sizing is based on heat loss from the surface with an assumed wind velocity of 3 1/2 mph. This is normally suitable for pools sheltered by nearby fences, buildings or shrubs from prevailing winds. For more exposed areas, increase the heater capacity requirement by 1.25 for a 5 mph wind velocity and by 2.0 for a 10 mph velocity. EXAMPLE: A 1,000 sq. ft. surface area pool with a desired water temperature of 80°F, with an average lowest air temperature of 60° (20° temperature difference), in an exposed area, with an assumed wind velocity at the surface of 10 mph, rather than selecting the Model DR or F350-WP as shown in the above chart for a sheltered pool, multiply the requirement by 2.0 and select a Model DR or F650-WP.

**TO SIZE HEATER - BASED ON GALLONAGE AND TIME-RISE:**

1. Simply determine the pool capacity in gallons and select heater. The sizing on this chart is based on raising the pool temperature approximately 1°F per hour. If it is desired to raise the temperature faster, increase the heater capacity requirement accordingly. EXAMPLE: To raise the temperature to a 40,000 gallon pool 2° per hour, the heater should be approximately twice the capacity of a Model DR or F650-WP - selecting a Model CLM150-WP (1,500,000 BTU).

**TO SIZE HEATER - INDOOR POOL IN HEATED BUILDING:**

1. Determine the surface area.
2. Multiply the surface area by 125. This will be the heater BTU input required. EXAMPLE: a 40' x 75' indoor pool, 3,000 sq. ft. surface area -  $3,000 \times 125 = 375,000$  BTU input. Select the DR or F350-WP and/or DR or F450-WP

**NOTE:**

1. To size the Bryan Electric and the Bryan Heat Exchanger Type Pool Heater, use the same method as shown above, using a heater rated with an output equivalent to the output of the gas or oil fired model shown on the chart.
2. For a mountain or winter resorts operating year round, and for pools operating in extremely cool climate areas, contact the Bryan representative for sizing recommendations.
3. For high altitude areas (above 4,000') assume requirements to be greater by 4% per each 1,000' above sea level.
4. These requirements are based generally on the recommendations of the National Swimming Pool Institute.
